What is Systems Biology? Imperial College London

Perhaps surprisingly, a concise definition of *Systems Biology* that most of us can agree upon has yet to emerge.

Ruedi Aebersold
Institute for Systems Biology, Seattle

Systems Research Imperial College
London

Definition (Ludwig von Bertalanffy, 1901-1972):
A system is an entity that maintains its existence through the mutual interaction of its parts.

System

Parts

Kohl P & Noble D. *Nature Molecular Systems Biology* 2009/5:292.

Systems Research in Biomedicine Imperial College
London

Systems Research: combines

- (i) identification and
- (ii) detailed characterisation of parts, with
- (iii) exploration of their interactions with each other &
- (iv) with the environment, to
- (v) develop a systemic understanding of the entity, including its effects on (i) to (iv).

'Systems Biology': an *approach* that applies the principles of Systems Research to biological entities.

It is characterised by *dynamic integration* of 'reduction' and 'integration'.

Kohl P & Noble D. *Nature Molecular Systems Biology* 2009/5:292.

What are the Tools? Imperial College
London

Reality **Insight**

Models

What is a Model? Imperial College London

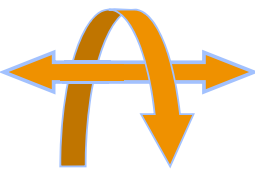

Model =

there is no one-to-one map between reality and models

Kohl P, Crampin E, Quinn TA & Noble D. *Nature Clinical Pharmacology & Therapeutics* 2010;88:25-33.

How to Pick 'the Right' Tools? Imperial College London

Reality

Insight

Models

- Relevant
- Representative
- Reproducible
- Reasonable

Models of Biological Systems Imperial College London

	←		→		←

Surely Genes Determine Life?! Imperial College London

Phenotype

DNA

original concept of 'gene' ≡ 'determinants of phenotype'

molecular biology notion: gene = DNA sequence

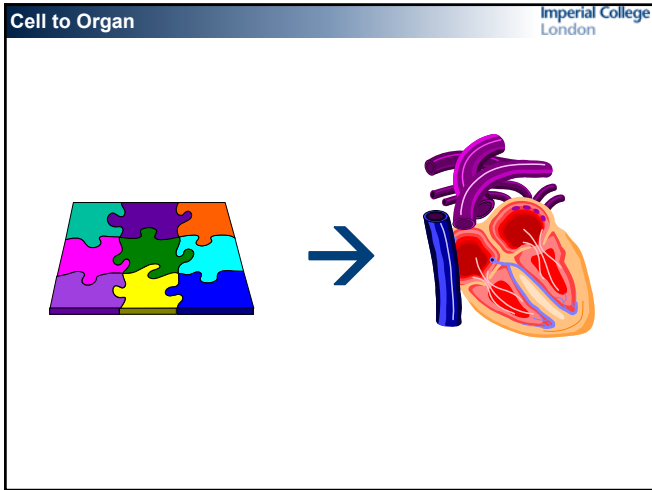

Kohl P, Crampin E, Quinn TA & Noble D. *Nature Clinical Pharmacology & Therapeutics* 2010/88:25-33.

- Concept & Definitions
- Examples from the Heart
- Mission Impossible
- Praise of Failure

Heart Modelling Imperial College London

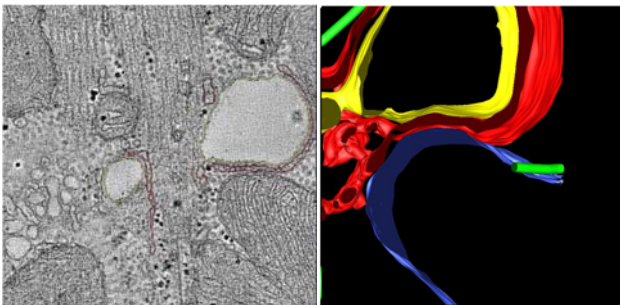

- Currently best developed organ model
- High degree of spatio-temporal regularity
- High-quality structure and function data (ECG to patch clamp, histo to CT and MRI, etc.)
- Long history (Phillips light bulb model 1928; bio-physical cell models since 1960, bulk 3D cardiac geometry models 1990s, histo-anatomical models 2000s)
- High relevance / visibility

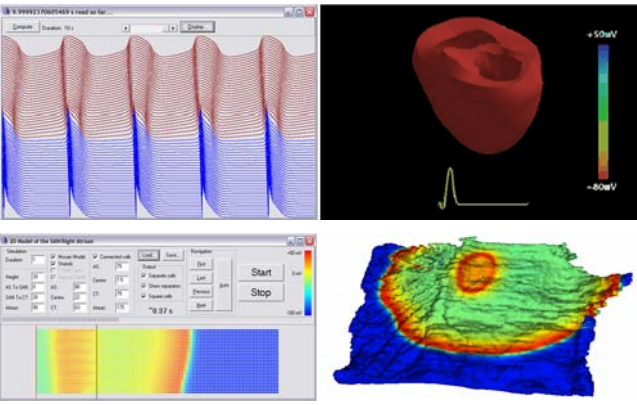

3D Nanoscale: the Missing Link Imperial College London

EM Tomography (4 nm)

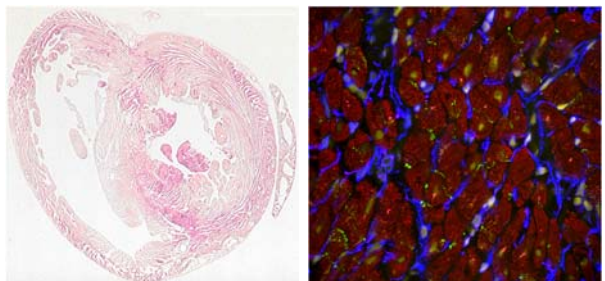

Irbe G et al. Circulation Research 2009/104:787-795.

Cell to ECG Imperial College London

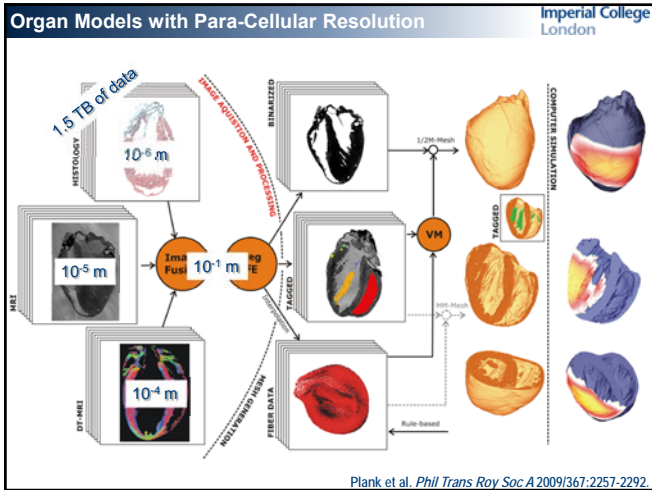

Garry A et al. *Intl J Bifurcation & Chaos* 2003/13:3579-3590. Winslow lab, JHU, ca. 1998.

What Cell? Muscle is Non-Homogeneous! Imperial College London

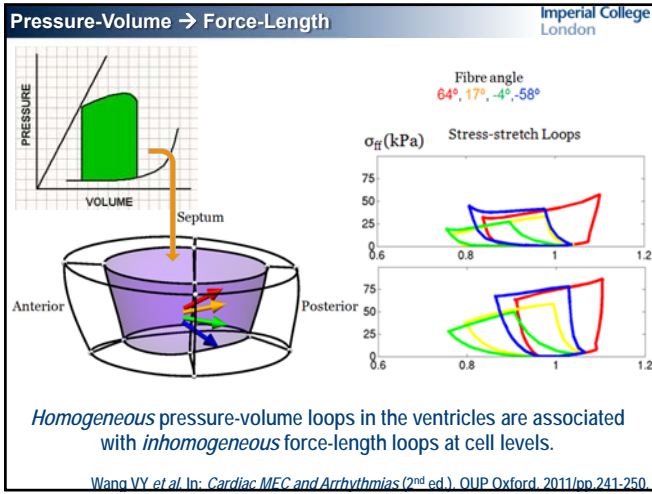

Largest by volume: cardiomyocytes. Largest by numbers: fibroblasts.
 ...plus endothelium, vascular smooth muscle, blood & immune cells, neurones.

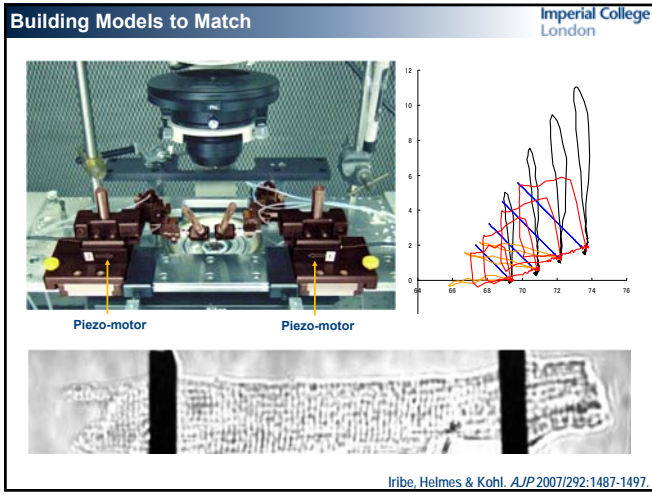

Camelliti P & Kohl P. Heart Rhythm 2012/9:461-466

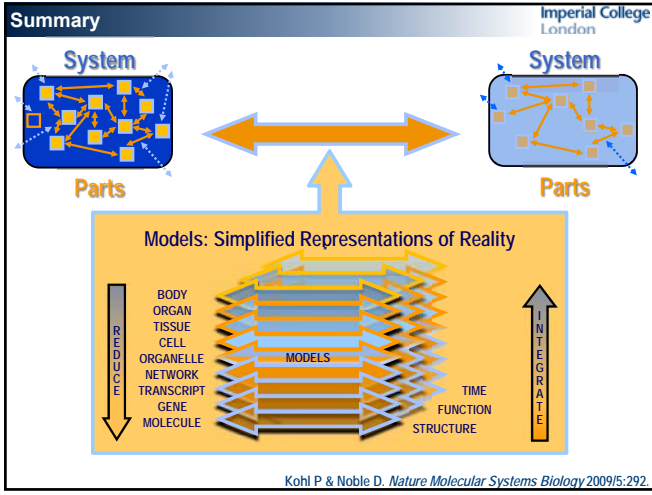

Challenges Imperial College
London

- Noninvasive imaging (preferably human)
- Structure mapping
- Motion = artifact
- L: Nano-to-Micro
0.1 nm to 100 μm (10⁶)
- L: Micro-to-Macro
1 μm to m (10⁶)
- High spatio-temporal resolution
- Function prediction
- No motion = exitus
- T: Nano-to-Micro
ns to seconds (10⁹)
- T: Micro-to-Macro
ms to months (10⁹)

Kohl P & Noble D. *Nature Molecular Systems Biology* 2009/5:292.

Mission Imperative! Imperial College
London

No alternative for quantitative study of dynamic structure-function interactions in complex systems, but beware of 'plausibility trap'.

Quantitative 'dry' models *can* guide insight if conducted in iteration with 'wet' experiments / observations for data input and hypothesis validation.

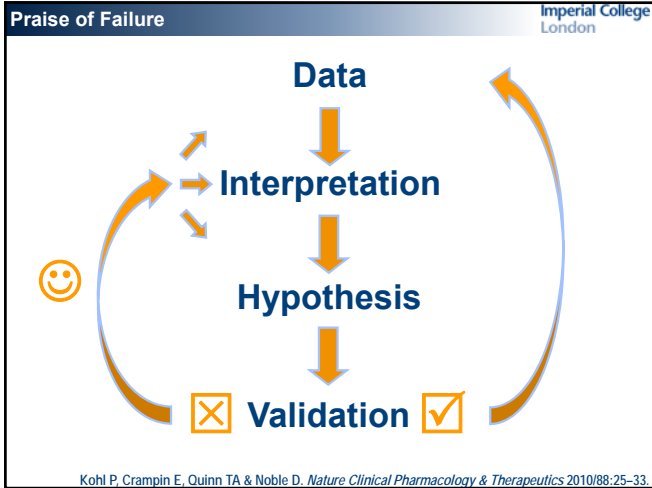

System behaviour is 'multi-scale'.

There is no 'privileged' level of insight (although the cell is a pragmatically useful reference point for many biological systems).

Kohl P & Noble D. *Nature Molecular Systems Biology* 2009/5:292.
