Imperial College
London

Atherosclerosis

- Introduction
- Pathology
- Cholesterol and inflammation
- Importance of blood flow
- Investigating molecular mechanisms

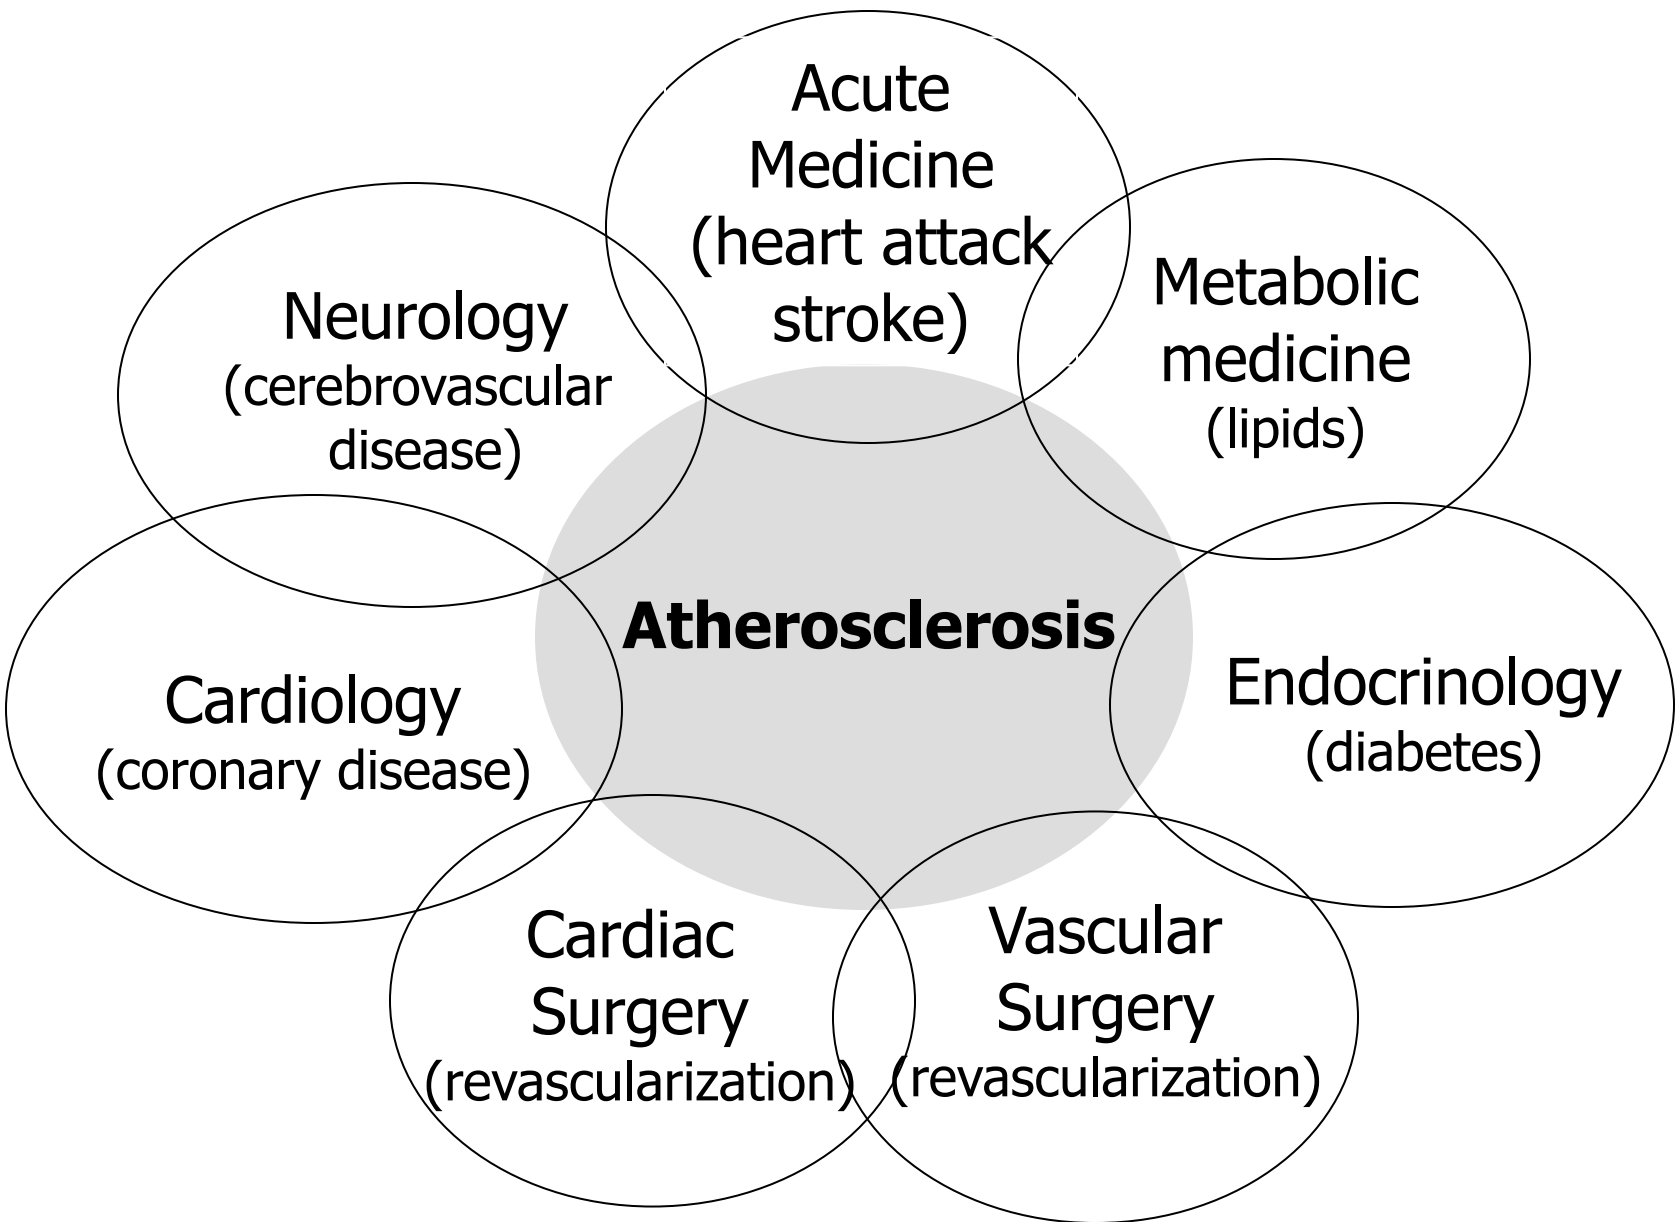

World disease burden

1990

2020

Adapted from Lopez and Murray (1998) Nature Med 4: 1241

Risk Factors

Modifiable

dyslipidaemia
smoking
hypertension
diabetes mellitus
visceral obesity
lack of exercise
raised homocysteine

Not modifiable

Age
Sex
Genetics

Relative importance of risk factors

Danesh et al 2004 N Engl J Med 350:1387

Risk factor interactions

PATHOLOGY

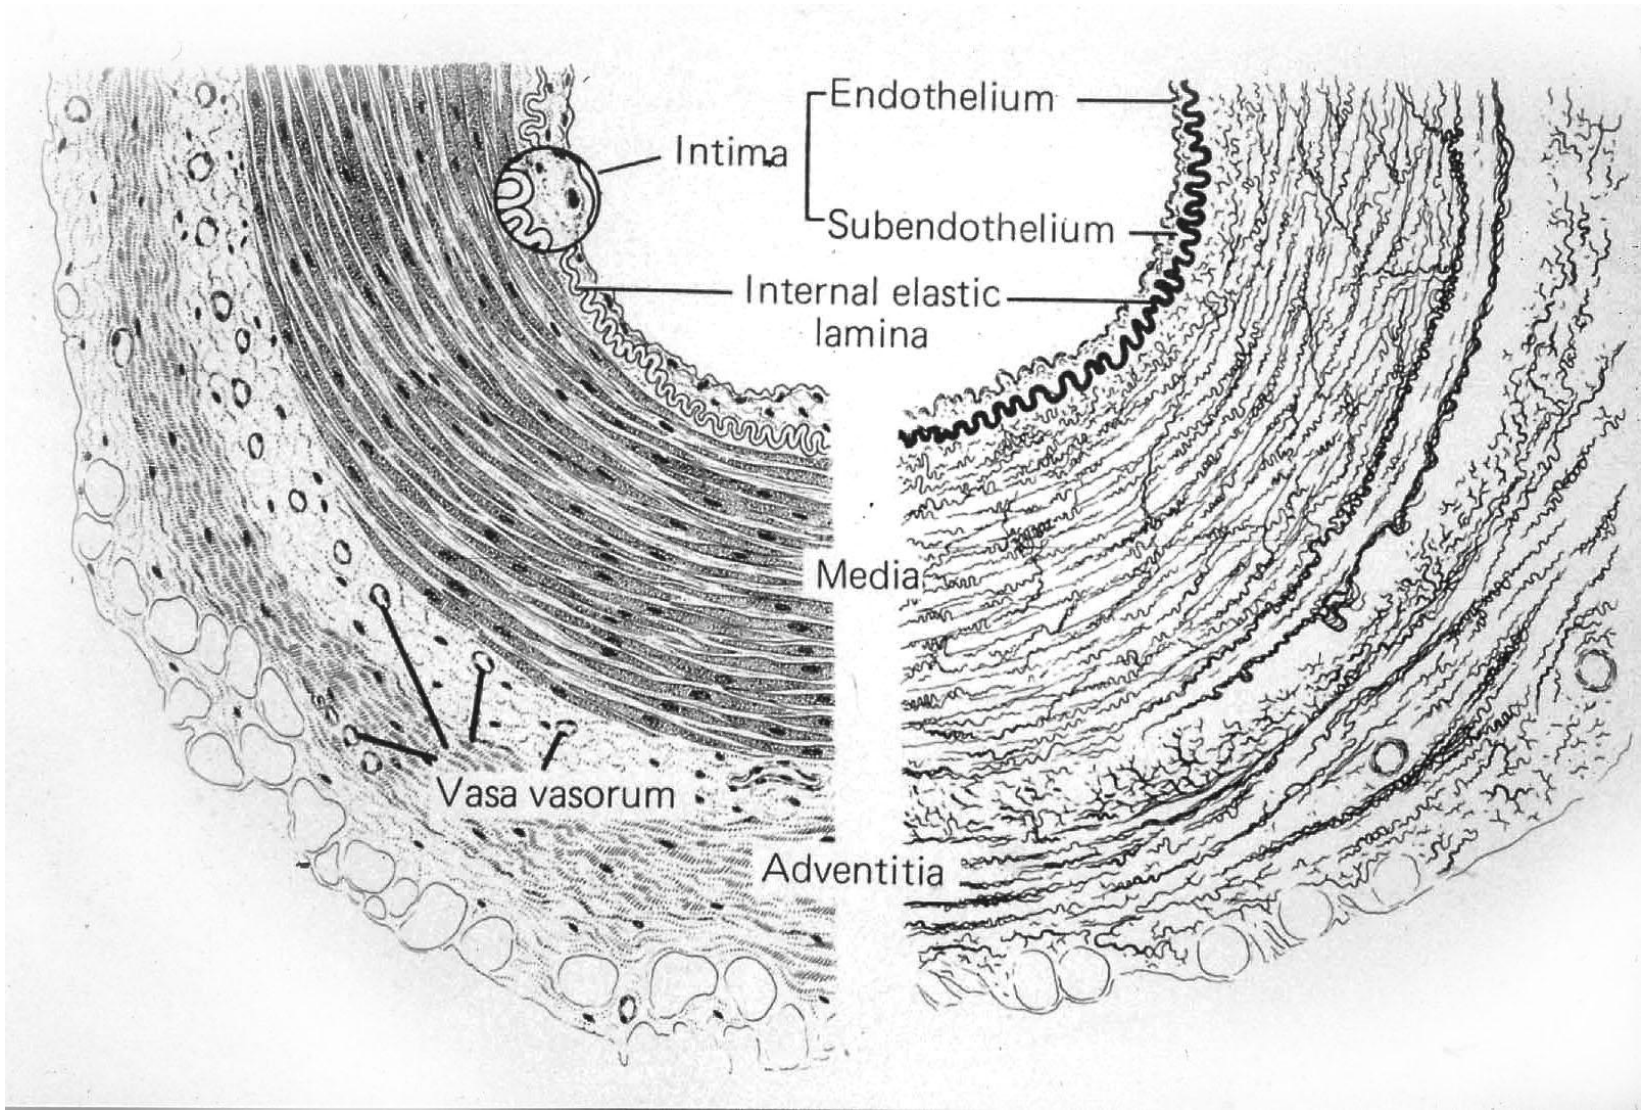

fatty streaks

intermediate lesion

ulcerated plaque

Intima

Endothelium

Subendothelium

Internal elastic lamina

Media

Vasa vasorum

Adventitia

Type II lesion

Type IV lesion

Debris (eg modified lipoproteins, apoptotic cells)

Reversible fatty lesions

Irreversible remodelling

wound healing

Stable plaques

inflammation/thrombosis

Unstable plaques

Ischaemia

Thrombosis, embolism

Angina
Intermittant claudication

Acute coronary syndromes
Stroke
Peripheral gangrene

Thrombus occluding left anterior descending coronary artery

Myocardial infarct

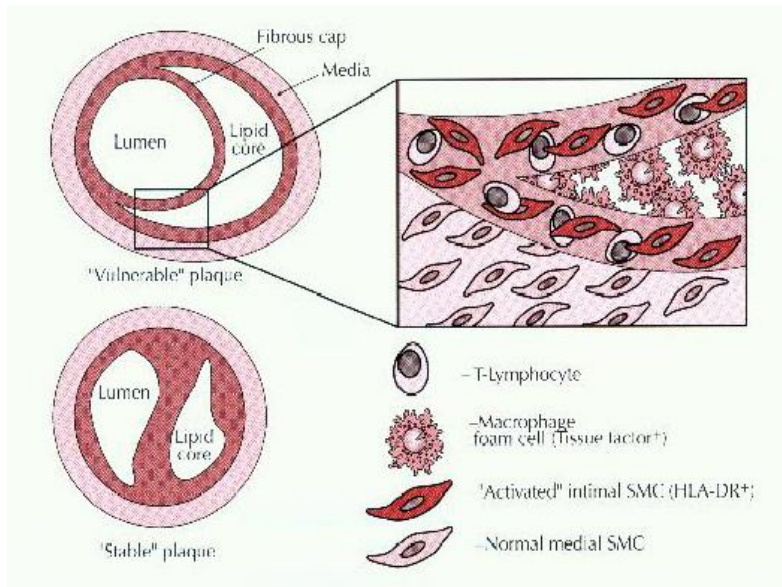

Left ventricle

Main cellular players

- **Vascular endothelial cells**
 - Barrier function (eg to lipoproteins)
 - Leukocyte recruitment
- **Platelets**
 - Thrombus generation
 - Cytokine and growth factor release
- **Monocyte-macrophages**
 - Foam cell formation
 - Cytokine and growth factor release
 - Major source of free radicals
 - Metalloproteinases
- **T lymphocytes**
 - Macrophage activation
- **Vascular smooth muscle cells**
 - Migration and proliferation
 - Collagen synthesis
 - Remodelling and fibrous cap formation

Factors predisposing to instability

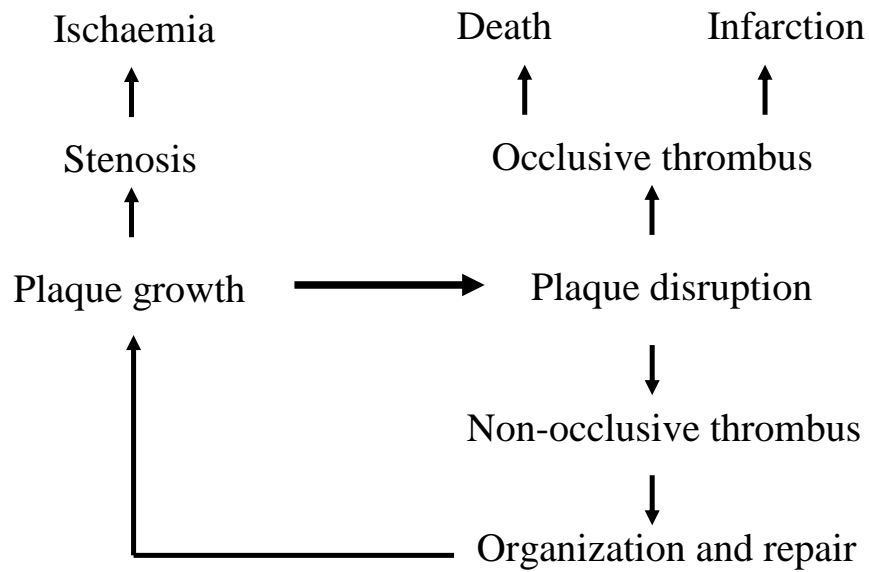

- Large soft eccentric lipid-rich core
- Thin fibrous plaque ($< 65 \mu\text{m}$)
- Low collagen content / VSMC density
- Infiltrate of activated mo-mø and T cells
- Neovascularization

*Van der Wal et al 1999
Cardiovascular Research 41:334*

Step-wise progression of atherosclerotic plaques

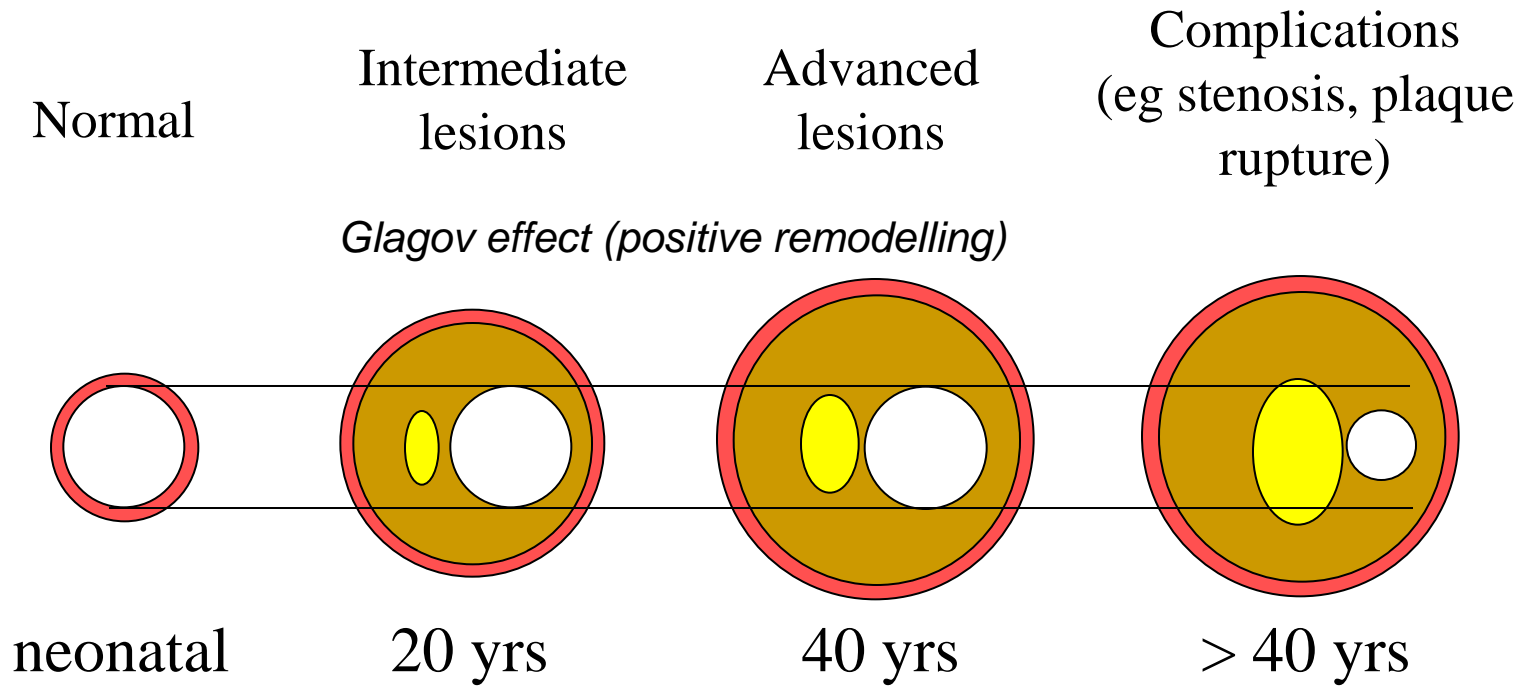

Vasa vasorum are the back-door for leukocyte recruitment

De Boer et al (1999) Cardiovasc Res 41:443.

Natural history of atherosclerosis

CORONARY DISEASE AMONG UNITED STATES SOLDIERS KILLED IN ACTION IN KOREA

**Major William F. Enos, Lieut. Col. Robert H. Holmes (MC), U.S. Army
and
Capt. James Beyer (MC), Army of the U.S.**

Journal of the American Medical Association July 18th, 1953, p1090

- 300 autopsies performed on United States battle casualties in Korea
- Cases with known coronary disease excluded from study
- Average age 22.1 years – (range 18-48 years)
- 77.3% of hearts showed some gross evidence of coronary disease
- such coronary changes rare in Koreans

Minor (~30%) stenosis of
R internal carotid artery

Atherosclerotic plaque occupying
~80% of arterial cross-section

CHOLESTEROL AND INFLAMMATION

History – the cholesterol hypothesis

N. N. Anitschkow
Military Medical Academy of St Petersburg
(circa 1904)

Plaque from a rabbit fed
cholesterol for 106 days and
then chow for >2 years

Low density lipoproteins (LDL) deposit in the subintimal space at sites of low/complex flow, and bind to matrix proteoglycans

McIntyre et al 1999 J Biol Chem 274:25189

Staining of arteries with antibodies to oxidised phospholipids

Palinski et al 1996 J Clin Invest 98:800

LDL modification in the arterial wall happens before macrophage infiltration

MDA-lysine
(oxidised LDL)

monocyte/mø

Macrophage scavenger receptors

from Pluddemann et al (2007) Methods 43:207

Macrophage uptake of LDL

- Physiological uptake of LDL via LDL controlled by receptor down-regulation
- Uptake of oxidised LDL by scavenger receptors is not regulated and results in “foam cell” formation.
- Cholesterol-laden macrophages release cytokines (eg IL-1, TNF) and growth factors (eg PDGF), and die by apoptosis or necrosis

from Dr Howard Kruth

Faggiotto et al 1984 Arteriosclerosis 4:323

Homeostatic debris disposal

Inflammatory genesis of arterial remodel

Low probability (HP)

High probability (HP)

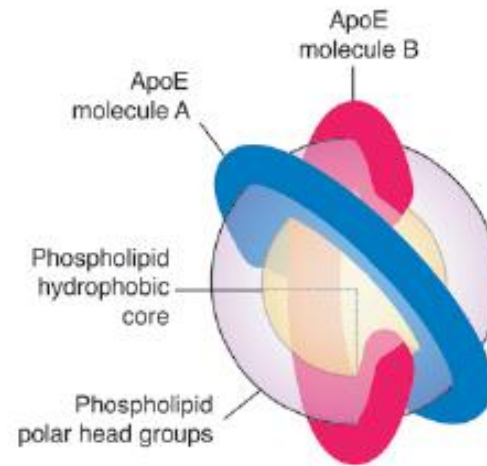

Differential adhesion molecule expression in the murine aorta shown by *en face* immunostaining

INVESTIGATING MOLECULAR MECHANISMS

Mouse models of atherosclerosis

- **ApoE^{-/-}**
 - 34kd component of VLDL and chylomicrons
 - ligand for LDL receptor
- **LDL receptor ^{-/-}**
 - Mutations in familial hypercholesterolaemia

Atherosclerosis in *Ldlr*^{-/-} mice

Ishibashi et al 1994 JCI 93:1885

Influence of adhesion molecules, chemokines and cytokines on mouse atherosclerosis

Accelerators

Adhesion molecules

P-selectin
E-selectin
ICAM-1
VCAM-1

Chemokines & receptors

MCP-1
CCR2
CXCR2
CX3CR1

Cytokines

IL-1
TNF α
IL-4
IL-6
IL-12
IL-18
IFN γ

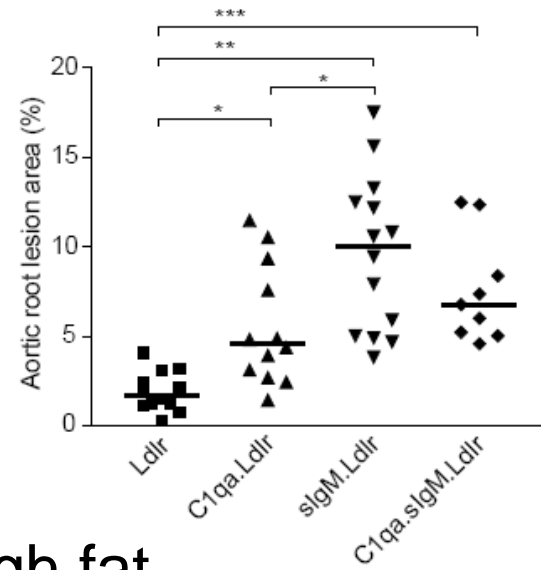

Decelerators

IL1RA
TGF β
IL-10

IgM deficiency accelerates atherosclerosis

Low fat

High fat

Hypothetical model of the role of complement and IgM natural antibodies in atherosclerosis

Homeostatic clearance

Role of T lymphocytes in atherosclerosis

- Atherosclerotic plaques contain MHC Class II positive dendritic cells and T lymphocytes at all stages
- Plaque T cells show evidence of activation (eg HLA-DR, IFN γ)
- Plaque T cells are oligoclonal and ~10% react with oxidised LDL
- T cells may activate macrophages and VSMC (eg via CD40L-CD40 contact interactions)

Effects of CD4 T cell transfer

Zhou et al (2006) ATVB 26:864

Summary

- Atherosclerosis can be viewed as a dynamic chronic inflammatory disease of arteries
- The innate immune system regulates the safe disposal of lipoproteins and other debris from the arterial wall and is intrinsically protective
- Overdrive of the innate immune system leads to irreversible remodelling, and this may be accelerated by adaptive immune mechanisms
- The interplay between proinflammatory and wound healing pathways governs plaque stability
